

AirLink OS 5.0.46

RELEASE NOTES

About AirLink OS 5.0.46

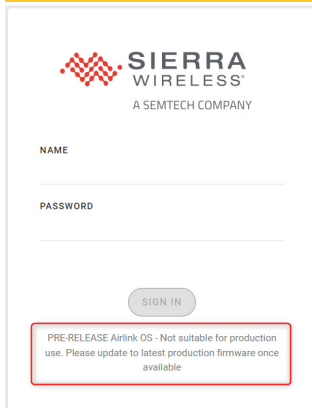

AirLink OS 5.0.46 is a pre-release AirLink OS for the AirLink XR60. This version is installed in XR60 routers manufactured prior to May 2024 and contains only the Generic radio module firmware image.

Semtech recommends upgrading to the latest AirLink OS version for the XR60, and performing a factory reset once you are ready to deploy the router. This process will install the latest certified radio module firmware images.

Version Notes

As a pre-release version, AirLink OS 5.0.46 displays a banner and login screen text highlighting that it is not suitable for production use. The login screen text will persist (as shown below) until an upgrade to a production version and factory reset is performed. Resetting devices to factory default is always recommended when upgrading from a pre-release version to a production version.

PRE-RELEASE Airlink OS - Not suitable for production use. Please update to latest production firmware once available

The screenshot shows the AirLink OS login interface. At the top left is the Sierra Wireless logo with the text 'SIERRA WIRELESS' and 'A SEMTECH COMPANY' below it. Below the logo are two input fields labeled 'NAME' and 'PASSWORD'. A 'SIGN IN' button is positioned below the password field. At the bottom of the screen, a red-bordered box contains the warning text: 'PRE-RELEASE Airlink OS - Not suitable for production use. Please update to latest production firmware once available'.

Known Issue

AirLink OS

An issue exists where the AirLink OS user interface will fail to load after the login screen if there are no notifications. See [this bulletin](#) for more information.
